1i	content-related prior knowledge or skills	n.a.
1j	learning contents	Plants play key role in sustaining life on earth as source of food, shelter and energy. Polyploidization, an increase in genome copies, has been a major driving force for the increase in performance of crop plants and continues to be important breeding goal. We recently discovered that polyspermy, the fusion of an egg with two sperm, is route towards polyploidization. However, polyspermy barriers are in place making this a rare event. To tackle the bottleneck of polyspermy block, the students will target potential polyspermy regulating molecular factors making use of CRISPR/Cas9 based gene editing tool.

		<p>Learning contents:</p> <p>Master students will have the opportunity to develop and realize their own research idea with the support of experts in the field.</p> <p>As part of the holistic concept the students will generate CRISPR/Cas9 genome editing construct to then follow the approach up until the generation and identification of the mutant. Special attention is given to the conceptualization and design of experiments. In addition, students will learn basic techniques for science communication, professional presentation, and poster design.</p>																																																								
1k	learning outcomes/ competencies/ targeted competencies	<ul style="list-style-type: none"> • Students can design and implement CRISPR/Cas9 based genome editing • Students have the ability to conceive and develop their own research project • Students can apply their conceptual knowledge to design experiments • Students can communicate and present scientific findings professionally • Student have in-depth knowledge regarding the mechanism of plant reproduction
